# Leavitt path algebras，$B_{\infty}$－algebras and Keller＇s conjecture for singular Hochschild cohomology 

陈小伍，中国科学技术大学

第三届代数与表示论前沿进展研讨会北京师范大学，2020．9．19－20

## Overview

－Keller＇s conjecture links the singular Hochschild cohomology to the Hochschild cohomology of the dg singularity category， on the $B_{\infty}$－level

## Overview

－Keller＇s conjecture links the singular Hochschild cohomology to the Hochschild cohomology of the dg singularity category， on the $B_{\infty}$－level
－Confirm Keller＇s conjecture for finite dimensional algebras with radical square zero，via Leavitt path algebras（which are usually infinite dimensional）

## Overview

－Keller＇s conjecture links the singular Hochschild cohomology to the Hochschild cohomology of the dg singularity category， on the $B_{\infty}$－level
－Confirm Keller＇s conjecture for finite dimensional algebras with radical square zero，via Leavitt path algebras（which are usually infinite dimensional）
－joint with 李换换（安徽大学），汪正方（斯图加特大学）

## The content

－An introduction to the singularity category
－Singular Hochschild cohomology and Keller＇s conjecture
－The main results
－Main ingredients of the proof

## The convention and notation

－We work over a fixed field $k$ ．
－$A=$ a finite dimensional associative $k$－algebra with unit
－$A$－mod $=$ the abelian category of finite dimensional left $A$－modules
－$A$－proj $=$ the full subcategory of finite dimensional projective $A$－modules

## The derived category

－ $\mathbf{D}^{b}(A-\bmod )=$ the bounded derived category of $A$－mod
－ $\mathbf{K}^{b}(A$－proj $)=$ the bounded homotopy category of $A$－proj
－View $\mathbf{K}^{b}(A$－proj $) \subseteq \mathbf{D}^{b}(A$－mod $)$ a full triangulated subcategory

## The derived category

－ $\mathbf{D}^{b}(A-\mathrm{mod})=$ the bounded derived category of $A$－mod
－ $\mathbf{K}^{b}(A$－proj $)=$ the bounded homotopy category of $A$－proj
－View $\mathbf{K}^{b}(A$－proj $) \subseteq \mathbf{D}^{b}(A$－mod $)$ a full triangulated subcategory

## Lemma

$\mathbf{K}^{b}(A$－proj $)=\mathbf{D}^{b}(A$－mod $)$ if and only if gl．dim $(A)<\infty$ ．

## The singularity category

## Definition（Buchweitz 1987／Orlov 2004）

The singularity category of $A$ is the Verdier quotient category

$$
\mathbf{D}_{\mathrm{sg}}(A)=\mathbf{D}^{b}(A-\bmod ) / \mathbf{K}^{b}(A-\operatorname{proj}) .
$$

## The singularity category

## Definition（Buchweitz 1987／Orlov 2004）

The singularity category of $A$ is the Verdier quotient category

$$
\mathbf{D}_{\mathrm{sg}}(A)=\mathbf{D}^{b}(A-\bmod ) / \mathbf{K}^{b}(A-\operatorname{proj}) .
$$

－ $\mathbf{D}_{\mathrm{sg}}(A)$ vanishes if and only if gl．dim $(A)<\infty$

## The singularity category

## Definition（Buchweitz 1987／Orlov 2004）

The singularity category of $A$ is the Verdier quotient category

$$
\mathbf{D}_{\mathrm{sg}}(A)=\mathbf{D}^{b}(A-\bmod ) / \mathbf{K}^{b}(A-\operatorname{proj}) .
$$

－ $\mathbf{D}_{\mathrm{sg}}(A)$ vanishes if and only if gl． $\operatorname{dim}(A)<\infty$
－ $\mathbf{D}_{\text {sg }}(A)$ is a homological invariant for algebras with infinite global dimension

## The singularity category

## Definition（Buchweitz 1987／Orlov 2004）

The singularity category of $A$ is the Verdier quotient category

$$
\mathbf{D}_{\mathrm{sg}}(A)=\mathbf{D}^{b}(A-\bmod ) / \mathbf{K}^{b}(A-\operatorname{proj}) .
$$

－ $\mathbf{D}_{\mathrm{sg}}(A)$ vanishes if and only if $\mathrm{gl} \cdot \operatorname{dim}(A)<\infty$
－ $\mathbf{D}_{\text {sg }}(A)$ is a homological invariant for algebras with infinite global dimension
－ $\mathbf{D}_{\mathrm{sg}}(A)$ is invariant under derived equivalences

## Aspects of singularity categories

－in mathematical physics，singularity categories are viewed as the B－side in the homological mirror symmetry of LG models

## Aspects of singularity categories

－in mathematical physics，singularity categories are viewed as the B－side in the homological mirror symmetry of LG models
－in commutative algebra，it relates to matrix factorizations and classical singularities of equations

## Aspects of singularity categories

－in mathematical physics，singularity categories are viewed as the B－side in the homological mirror symmetry of LG models
－in commutative algebra，it relates to matrix factorizations and classical singularities of equations
－in noncommutative geometry，its graded version relates to the bounded derived category of sheaves over noncommutative projective schemes

## Aspects of singularity categories

－in mathematical physics，singularity categories are viewed as the B－side in the homological mirror symmetry of LG models
－in commutative algebra，it relates to matrix factorizations and classical singularities of equations
－in noncommutative geometry，its graded version relates to the bounded derived category of sheaves over noncommutative projective schemes
－in homological algebra，it relates to Gorenstein projective modules，and Tate－Vogel cohomology

## Singularity category via stablization

－The stable module category $A$－mod $=A$－mod $/[A$－proj］：killing morphisms factoring through projectives

## Singularity category via stablization

－The stable module category $A$－mod $=A$－mod $/[A$－proj］：killing morphisms factoring through projectives
－The stable module category $A$－mod is left triangulated

## Singularity category via stablization

－The stable module category $A$－mod $=A$－mod $/[A$－proj］：killing morphisms factoring through projectives
－The stable module category $A$－mod is left triangulated
－The syzygy functor $\Omega$ ：$A$－$\underline{\text { mod }} \longrightarrow A$－mod（usually not an equivalence！）

## Singularity category via stablization

－The stable module category $A$－mod $=A$－mod $/[A$－proj］：killing morphisms factoring through projectives
－The stable module category $A$－mod is left triangulated
－The syzygy functor $\Omega$ ：$A$－$\underline{\text { mod }} \longrightarrow A$－mod（usually not an equivalence！）
－Short exact sequences induce exact triangles：

## Singularity category via stablization，continued

－The stablization $\mathcal{S}(A$－$\underline{\bmod })$ is obtained from $A$－$\underline{\bmod }$ by formally inverting $\Omega$ ！

## Singularity category via stablization，continued

－The stablization $\mathcal{S}(A-\underline{\bmod })$ is obtained from $A$－$\underline{\bmod }$ by formally inverting $\Omega$ ！
－More precisely，the objects are $(M, n)$ ，with an $A$－module $M$ and $n \in \mathbb{Z}$ ；the morphisms are given
$\operatorname{Hom}((M, n),(L, m))=\operatorname{colim} \underline{\operatorname{Hom}}_{A}\left(\Omega^{i-n}(M), \Omega^{i-m}(L)\right)$

## Singularity category via stablization，continued

－The stablization $\mathcal{S}(A-\underline{\bmod })$ is obtained from $A$－$\underline{\bmod }$ by formally inverting $\Omega$ ！
－More precisely，the objects are $(M, n)$ ，with an $A$－module $M$ and $n \in \mathbb{Z}$ ；the morphisms are given
$\operatorname{Hom}((M, n),(L, m))=\operatorname{colim} \underline{\operatorname{Hom}}_{A}\left(\Omega^{i-n}(M), \Omega^{i-m}(L)\right)$
－$\Omega$ now becomes $M=(M, 0) \mapsto(M,-1)$ ，an automorphism！

## Singularity category via stablization，continued

－The stablization $\mathcal{S}(A$－$\underline{\bmod })$ is obtained from $A$－$\underline{\bmod }$ by formally inverting $\Omega$ ！
－More precisely，the objects are $(M, n)$ ，with an $A$－module $M$ and $n \in \mathbb{Z}$ ；the morphisms are given
$\operatorname{Hom}((M, n),(L, m))=\operatorname{colim} \underline{\operatorname{Hom}}_{A}\left(\Omega^{i-n}(M), \Omega^{i-m}(L)\right)$
－$\Omega$ now becomes $M=(M, 0) \mapsto(M,-1)$ ，an automorphism！
－The stabilization $\mathcal{S}(A-\underline{\bmod })$ is naturally triangulated．

## Theorem（Keller－Vossieck 1987／Beligiannis 2000）

There is a triangle equivalence

$$
\mathcal{S}(A-\underline{\bmod }) \simeq \mathbf{D}_{\mathrm{sg}}(A)
$$

## The dg singularity category

The dg quotient［Keller 1999／Drinfeld 2004］enhances the Verdier quotient

## The dg singularity category

The dg quotient［Keller 1999／Drinfeld 2004］enhances the Verdier quotient for example， $\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)=$ the bounded dg derived category：a dg category with $H^{0}\left(\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod )\right)=\mathbf{D}^{b}(A-\bmod )$

## The dg singularity category

The dg quotient［Keller 1999／Drinfeld 2004］enhances the Verdier quotient for example， $\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)=$ the bounded dg derived category：a dg category with $H^{0}\left(\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod )\right)=\mathbf{D}^{b}(A-\bmod )$

## Definition（Keller 2018）

The $d g$ singularity category of $A$ is given by the dg quotient

$$
\mathbf{S}_{\mathrm{dg}}(A)=\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod ) / \mathbf{C}_{\mathrm{dg}}^{b}(A-\mathrm{proj})
$$

## The dg singularity category

The dg quotient［Keller 1999／Drinfeld 2004］enhances the Verdier quotient for example， $\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)=$ the bounded dg derived category：a dg category with $H^{0}\left(\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod )\right)=\mathbf{D}^{b}(A-\bmod )$

## Definition（Keller 2018）

The $d g$ singularity category of $A$ is given by the dg quotient

$$
\mathbf{S}_{\mathrm{dg}}(A)=\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod ) / \mathbf{C}_{\mathrm{dg}}^{b}(A-\mathrm{proj})
$$

－ $\mathbf{S}_{\mathrm{dg}}(A)$ is a finer invariant as $H^{0}\left(\mathbf{S}_{\mathrm{dg}}(A)\right)=\mathbf{D}_{\mathrm{sg}}(A)$

## The dg singularity category

The dg quotient［Keller 1999／Drinfeld 2004］enhances the Verdier quotient for example， $\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)=$ the bounded dg derived category：a dg category with $H^{0}\left(\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod )\right)=\mathbf{D}^{b}(A-\bmod )$

## Definition（Keller 2018）

The $d g$ singularity category of $A$ is given by the dg quotient

$$
\mathbf{S}_{\mathrm{dg}}(A)=\mathbf{D}_{\mathrm{dg}}^{b}(A-\bmod ) / \mathbf{C}_{\mathrm{dg}}^{b}(A-\text { proj})
$$

－ $\mathbf{S}_{\mathrm{dg}}(A)$ is a finer invariant as $H^{0}\left(\mathbf{S}_{\mathrm{dg}}(A)\right)=\mathbf{D}_{\mathrm{sg}}(A)$
－There are various＂realizations＂of $\mathbf{S}_{\mathrm{dg}}(A)$ ；cf．［C－Li－Wang］

## The content

－An introduction to the singularity category
－Singular Hochschild cohomology and Keller＇s conjecture
－The main results
－Main ingredients of the proof

## The singular Hochschild cohomology

－the enveloping algebra $A^{e}=A \otimes A^{\mathrm{op}}: A$－$A$－bimodules $=$ left $A^{e}$－modules

## The singular Hochschild cohomology

－the enveloping algebra $A^{e}=A \otimes A^{\mathrm{op}}: A-A$－bimodules $=\mathrm{left}$ $A^{e}$－modules
－The Hochschild cohomology of $A$

$$
\mathrm{HH}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}^{b}\left(A^{e}-\mathrm{mod}\right)}\left(A, \Sigma^{*}(A)\right)
$$

## The singular Hochschild cohomology

－the enveloping algebra $A^{e}=A \otimes A^{\mathrm{op}}: A$－$A$－bimodules $=$ left $A^{e}$－modules
－The Hochschild cohomology of $A$

$$
\operatorname{HH}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}^{b}\left(A^{e}-\mathrm{mod}\right)}\left(A, \Sigma^{*}(A)\right)
$$

－The singular Hochschild cohomology of $A$

$$
\operatorname{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}_{\mathrm{sg}}\left(A^{e}\right)}\left(A, \Sigma^{*}(A)\right)
$$

## The singular Hochschild cohomology

－the enveloping algebra $A^{e}=A \otimes A^{\mathrm{op}}: A$－$A$－bimodules $=$ left $A^{e}$－modules
－The Hochschild cohomology of $A$

$$
\operatorname{HH}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}^{b}\left(A^{e}-\mathrm{mod}\right)}\left(A, \Sigma^{*}(A)\right)
$$

－The singular Hochschild cohomology of $A$

$$
\operatorname{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}_{\mathrm{sg}}\left(A^{e}\right)}\left(A, \Sigma^{*}(A)\right)
$$

－Both are graded－commutative algebras

## The singular Hochschild cohomology

－the enveloping algebra $A^{e}=A \otimes A^{\mathrm{op}}: A-A$－bimodules $=\mathrm{left}$ $A^{e}$－modules
－The Hochschild cohomology of $A$

$$
\operatorname{HH}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}^{b}\left(A^{e}-\mathrm{mod}\right)}\left(A, \Sigma^{*}(A)\right)
$$

－The singular Hochschild cohomology of $A$

$$
\operatorname{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{Hom}_{\mathbf{D}_{\mathrm{sg}}\left(A^{e}\right)}\left(A, \Sigma^{*}(A)\right)
$$

－Both are graded－commutative algebras
－The Hochschild cohomology are well known to relate to deformation theory and noncommutative differential geometry．．．

## Keller＇s theorem，the background

－ $\mathrm{HH}^{*}$ is defined naturally for any dg categories：the deformation theory of categories

## Keller＇s theorem，the background

－ $\mathrm{HH}^{*}$ is defined naturally for any dg categories：the deformation theory of categories
－Set $\mathbf{D}^{b}=\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)$ the bounded dg derived category

## Keller＇s theorem，the background

－ $\mathrm{HH}^{*}$ is defined naturally for any dg categories：the deformation theory of categories
－Set $\mathbf{D}^{b}=\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)$ the bounded dg derived category
－There is a canonical triangle embedding

$$
\mathbf{D}^{b}\left(A^{e}-\bmod \right) \hookrightarrow \mathbf{D}\left(\mathbf{D}^{b}\right), \quad X \mapsto \mathbb{R} \operatorname{Hom}_{A}\left(-, X \otimes_{A}^{\mathbb{L}}-\right)
$$

inducing an isomorphism

$$
\operatorname{HH}^{*}(A, A) \simeq \mathrm{HH}^{*}\left(\mathbf{D}^{b}, \mathbf{D}^{b}\right)
$$

## Keller＇s theorem，the background

－ $\mathrm{HH}^{*}$ is defined naturally for any dg categories：the deformation theory of categories
－Set $\mathbf{D}^{b}=\mathbf{D}_{\mathrm{dg}}^{b}(A$－mod $)$ the bounded dg derived category
－There is a canonical triangle embedding

$$
\mathbf{D}^{b}\left(A^{e}-\bmod \right) \hookrightarrow \mathbf{D}\left(\mathbf{D}^{b}\right), \quad X \mapsto \mathbb{R} \operatorname{Hom}_{A}\left(-, X \otimes_{A}^{\mathbb{L}}-\right)
$$

inducing an isomorphism

$$
\operatorname{HH}^{*}(A, A) \simeq \operatorname{HH}^{*}\left(\mathbf{D}^{b}, \mathbf{D}^{b}\right)
$$

－Lowen－Van den Bergh 2005：this isomorphism lifts to $B_{\infty}$－level

## Keller＇s theorem

## Theorem（Keller 2018）

Assume that $A / \operatorname{rad}(A)$ is separable over $k$ ．Then there is an canonical isomorphism of graded algebras

$$
\Phi: \mathrm{HH}_{\mathrm{sg}}^{*}(A, A) \longrightarrow \mathrm{HH}^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right) .
$$

## Keller＇s theorem

## Theorem（Keller 2018）

Assume that $A / \operatorname{rad}(A)$ is separable over $k$ ．Then there is an canonical isomorphism of graded algebras

$$
\Phi: \mathrm{HH}_{\mathrm{sg}}^{*}(A, A) \longrightarrow \mathrm{HH}^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)
$$

－The isomorphism is induced by a triangle functor

$$
\mathbf{D}_{\mathrm{sg}}\left(A^{e}\right) \longrightarrow \mathbf{D}\left(\mathbf{S}_{\mathrm{dg}}(A)\right)
$$

## Keller＇s theorem

## Theorem（Keller 2018）

Assume that $A / \operatorname{rad}(A)$ is separable over $k$ ．Then there is an canonical isomorphism of graded algebras

$$
\Phi: \mathrm{HH}_{\mathrm{sg}}^{*}(A, A) \longrightarrow \mathrm{HH}^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)
$$

－The isomorphism is induced by a triangle functor

$$
\mathbf{D}_{\mathrm{sg}}\left(A^{e}\right) \longrightarrow \mathbf{D}\left(\mathbf{S}_{\mathrm{dg}}(A)\right)
$$

－It is compatible with the previous isomorphism．

## Keller＇s theorem

## Theorem（Keller 2018）

Assume that $A / \operatorname{rad}(A)$ is separable over $k$ ．Then there is an canonical isomorphism of graded algebras

$$
\Phi: \mathrm{HH}_{\mathrm{sg}}^{*}(A, A) \longrightarrow \mathrm{HH}^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)
$$

－The isomorphism is induced by a triangle functor

$$
\mathbf{D}_{\mathrm{sg}}\left(A^{e}\right) \longrightarrow \mathbf{D}\left(\mathbf{S}_{\mathrm{dg}}(A)\right)
$$

－It is compatible with the previous isomorphism．
－It plays an essential role in Keller－Hua＇s work on Donovan－Wemyss＇s conjecture．

## Kelle＇s conjecture

## Conjecture（Keller 2018）

The isomorphism $\Phi$ lifts to $B_{\infty}$－level，in particular，$\Phi$ preserves the Gerstenhaber structures．

## Kelle＇s conjecture

## Conjecture（Keller 2018）

The isomorphism $\Phi$ lifts to $B_{\infty}$－level，in particular，$\Phi$ preserves the Gerstenhaber structures．

To be more precise，
－The Hochschild cochain complex $C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，lifting $\mathrm{HH}^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，is a $B_{\infty}$－algebra，with the cup product and brace operations

## Kelle＇s conjecture

## Conjecture（Keller 2018）

The isomorphism $\Phi$ lifts to $B_{\infty}$－level，in particular，$\Phi$ preserves the Gerstenhaber structures．

To be more precise，
－The Hochschild cochain complex $C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，lifting $\mathrm{HH}^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，is a $B_{\infty}$－algebra，with the cup product and brace operations
－The singular Hochschild cochain complex $C_{\mathrm{sg}}^{*}(A, A)$ ，lifting $\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)$ ，is also a $B_{\infty}$－algebra，with the cup product and brace operations［Wang 2018］

## The singular Hochschild cochain complex

－Following［Cuntz－Quillen 1995］，in the bar resolution，we have

$$
\Omega^{p}=(s \bar{A})^{\otimes p} \otimes A
$$

the（graded）bimodule of noncommutative differential p－forms

## The singular Hochschild cochain complex

－Following［Cuntz－Quillen 1995］，in the bar resolution，we have

$$
\Omega^{p}=(s \bar{A})^{\otimes p} \otimes A
$$

the（graded）bimodule of noncommutative differential p－forms
－using stabilization

$$
\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{colim} \mathrm{HH}^{*}\left(A, \Omega^{p}\right)
$$

## The singular Hochschild cochain complex

－Following［Cuntz－Quillen 1995］，in the bar resolution，we have

$$
\Omega^{p}=(s \bar{A})^{\otimes p} \otimes A
$$

the（graded）bimodule of noncommutative differential p－forms
－using stabilization

$$
\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{colim} \mathrm{HH}^{*}\left(A, \Omega^{p}\right)
$$

－There are natural cochain maps

$$
\theta_{p}: C^{*}\left(A, \Omega^{p}\right) \longrightarrow C^{*}\left(A, \Omega^{p+1}\right), \quad f \mapsto \operatorname{Id}_{s \bar{A}} \otimes f
$$

between the Hochschild cochain complexes．

## The singular Hochschild cochain complex

－Following［Cuntz－Quillen 1995］，in the bar resolution，we have

$$
\Omega^{p}=(s \bar{A})^{\otimes p} \otimes A
$$

the（graded）bimodule of noncommutative differential p－forms
－using stabilization

$$
\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{colim} \mathrm{HH}^{*}\left(A, \Omega^{p}\right)
$$

－There are natural cochain maps

$$
\theta_{p}: C^{*}\left(A, \Omega^{p}\right) \longrightarrow C^{*}\left(A, \Omega^{p+1}\right), \quad f \mapsto \operatorname{Id}_{s \bar{A}} \otimes f
$$

between the Hochschild cochain complexes．Therefore，taking the colimit，we obtain $C_{\mathrm{sg}}^{*}(A, A)$ ，called the singular Hochschild cochain complex of $A$ ；it computes $\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)$ ．

## The singular Hochschild cochain complex

－Following［Cuntz－Quillen 1995］，in the bar resolution，we have

$$
\Omega^{p}=(s \bar{A})^{\otimes p} \otimes A
$$

the（graded）bimodule of noncommutative differential p－forms
－using stabilization

$$
\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)=\operatorname{colim} \mathrm{HH}^{*}\left(A, \Omega^{p}\right)
$$

－There are natural cochain maps

$$
\theta_{p}: C^{*}\left(A, \Omega^{p}\right) \longrightarrow C^{*}\left(A, \Omega^{p+1}\right), \quad f \mapsto \operatorname{Id}_{s \bar{A}} \otimes f
$$

between the Hochschild cochain complexes．Therefore，taking the colimit，we obtain $C_{\mathrm{sg}}^{*}(A, A)$ ，called the singular Hochschild cochain complex of $A$ ；it computes $\mathrm{HH}_{\mathrm{sg}}^{*}(A, A)$ ．

## Wang＇s theorem

## Theorem（Wang 2018）

There is a natural $B_{\infty}$－algebra structure on $C_{\mathrm{sg}}^{*}(A, A)$ ．
－It is compatible with the inclusion $C^{*}(A, A) \hookrightarrow C_{\mathrm{sg}}^{*}(A, A)$ ．

## Wang＇s theorem

## Theorem（Wang 2018）

There is a natural $B_{\infty}$－algebra structure on $C_{\mathrm{sg}}^{*}(A, A)$ ．
－It is compatible with the inclusion $C^{*}(A, A) \hookrightarrow C_{\mathrm{sg}}^{*}(A, A)$ ．
－Two versions of $C_{\mathrm{sg}}^{*}(A, A)$ ，right and left；there is a nontrivial $B_{\infty}$－duality between them．

## A few words on $B_{\infty}$－algebras

（1）The notion of a $B_{\infty}$－algebra is due to［Getzler－Jones，1994］．

## A few words on $B_{\infty}$－algebras

（1）The notion of a $B_{\infty}$－algebra is due to［Getzler－Jones，1994］．
（2）Roughly speaking，a $B_{\infty}$－algebra $B$ is a graded Poisson algebra up to homotopy；its cohomology $H^{*}(B)$ is a Gerstenhaber algebra．

## A few words on $B_{\infty}$－algebras

（1）The notion of a $B_{\infty}$－algebra is due to［Getzler－Jones，1994］．
（2）Roughly speaking，a $B_{\infty}$－algebra $B$ is a graded Poisson algebra up to homotopy；its cohomology $H^{*}(B)$ is a Gerstenhaber algebra．
（3）a $B_{\infty}$－algebra is an $A_{\infty}$－algebra with $\mu_{p, q}: B^{\otimes p} \otimes B^{\otimes q} \rightarrow B$ with $p, q \geq 0$ ．

## A few words on $B_{\infty}$－algebras

（1）The notion of a $B_{\infty}$－algebra is due to［Getzler－Jones，1994］．
（2）Roughly speaking，a $B_{\infty}$－algebra $B$ is a graded Poisson algebra up to homotopy；its cohomology $H^{*}(B)$ is a Gerstenhaber algebra．
（3）a $B_{\infty}$－algebra is an $A_{\infty}$－algebra with $\mu_{p, q}: B^{\otimes p} \otimes B^{\otimes q} \rightarrow B$ with $p, q \geq 0$ ．
（9）Our concern：brace $B_{\infty}$－algebra，with dg algebra and $\mu_{p, q}=0$ for $p>1$ ；

## A few words on $B_{\infty}$－algebras

（1）The notion of a $B_{\infty}$－algebra is due to［Getzler－Jones，1994］．
（2）Roughly speaking，a $B_{\infty}$－algebra $B$ is a graded Poisson algebra up to homotopy；its cohomology $H^{*}(B)$ is a Gerstenhaber algebra．
（3）a $B_{\infty}$－algebra is an $A_{\infty}$－algebra with $\mu_{p, q}: B^{\otimes p} \otimes B^{\otimes q} \rightarrow B$ with $p, q \geq 0$ ．
（9）Our concern：brace $B_{\infty}$－algebra，with dg algebra and $\mu_{p, q}=0$ for $p>1$ ；more precisely，a dg algebra with brace operations subject to the higher pre－Jacobi identity，the distributivity，and the higher homotopy．

## Keller＇s conjecture，revisited

－Two（brace）$B_{\infty}$－algebras for $A$ ：the classical one $C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，and the singular one $C_{\mathrm{sg}}^{*}(A, A)$

## Keller＇s conjecture，revisited

－Two（brace）$B_{\infty}$－algebras for $A$ ：the classical one $C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，and the singular one $C_{\mathrm{sg}}^{*}(A, A)$
－Keller＇s theorem says that they have the same cohomology

## Keller＇s conjecture，revisited

－Two（brace）$B_{\infty}$－algebras for $A$ ：the classical one $C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，and the singular one $C_{\mathrm{sg}}^{*}(A, A)$
－Keller＇s theorem says that they have the same cohomology

## Conjecture（Keller 2018）

There is an isomorphism in the homotopy category of $B_{\infty}$－algebras

$$
C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right) \simeq C_{\mathrm{sg}}^{*}(A, A)
$$

In particular，the isomorphism on the cohomology respects the Gerstenhaber structures．

## Keller＇s conjecture，revisited

－Two（brace）$B_{\infty}$－algebras for $A$ ：the classical one $C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right)$ ，and the singular one $C_{\mathrm{sg}}^{*}(A, A)$
－Keller＇s theorem says that they have the same cohomology

## Conjecture（Keller 2018）

There is an isomorphism in the homotopy category of $B_{\infty}$－algebras

$$
C^{*}\left(\mathbf{S}_{\mathrm{dg}}(A), \mathbf{S}_{\mathrm{dg}}(A)\right) \simeq C_{\mathrm{sg}}^{*}(A, A)
$$

In particular，the isomorphism on the cohomology respects the Gerstenhaber structures．
－The stronger version：the above isomorphism is required to be compatible with the canonical isomorphism $\Phi$ ．
－We treat the above slightly weakened form．

## The content

－An introduction to the singularity category
－Singular Hochschild cohomology and Keller＇s conjecture
－The main results
－Main ingredients of the proof

## An invariance theorem

## Theorem（C．－Li－Wang）

Keller＇s conjecture is invariant under one－point（co）extensions and singular equivalences with levels．

## An invariance theorem

## Theorem（C．－Li－Wang）

Keller＇s conjecture is invariant under one－point（co）extensions and singular equivalences with levels．
－We can remove the sinks and sources from the quiver of $A$ ．

## An invariance theorem

## Theorem（C．－Li－Wang）

Keller＇s conjecture is invariant under one－point（co）extensions and singular equivalences with levels．
－We can remove the sinks and sources from the quiver of $A$ ．
－Keller＇s conjecture is invariant under derived equivalences．

## The proof of the invariance theorem

－It is well known that one－point（co）extensions and singular equivalences with level preserve singularity categories［C． 2011］，［Wang 2015］．

## The proof of the invariance theorem

－It is well known that one－point（co）extensions and singular equivalences with level preserve singularity categories［C． 2011］，［Wang 2015］．These equivalences lift to the dg singularity categories．

## The proof of the invariance theorem

－It is well known that one－point（co）extensions and singular equivalences with level preserve singularity categories［C． 2011］，［Wang 2015］．These equivalences lift to the dg singularity categories．
－For the invariance of $C_{\mathrm{sg}}^{*}(A, A)$ under one－point（co）extension， one constructs explicit $B_{\infty}$－quasi－isomorphisms；

## The proof of the invariance theorem

－It is well known that one－point（co）extensions and singular equivalences with level preserve singularity categories［C． 2011］，［Wang 2015］．These equivalences lift to the dg singularity categories．
－For the invariance of $C_{\mathrm{sg}}^{*}(A, A)$ under one－point（co）extension， one constructs explicit $B_{\infty}$－quasi－isomorphisms；for the invariance of $C_{\mathrm{sg}}^{*}(A, A)$ under singular equivalences with level， one modifies an argument by［Keller 2013］，using a triangular matrix algebra．

## Keller＇s conjecture for algebras with radical square zero

－$Q=$ a finite quiver without sinks
－$A_{Q}=k Q / J^{2}$ the algebra with radical square zero
－$L(Q)=$ the Leavitt path algebra

## Keller＇s conjecture for algebras with radical square zero

－$Q=$ a finite quiver without sinks
－$A_{Q}=k Q / J^{2}$ the algebra with radical square zero
－$L(Q)=$ the Leavitt path algebra

## Theorem（C．－Li－Wang）

Then there are isomorphisms in the homotopy category of
$B_{\infty}$－algebras

$$
C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \xrightarrow{\Upsilon} C^{*}(L(Q), L(Q)) \xrightarrow{\Delta} C^{*}\left(\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right), \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right)\right) .
$$

## Keller＇s conjecture for algebras with radical square zero

－$Q=$ a finite quiver without sinks
－$A_{Q}=k Q / J^{2}$ the algebra with radical square zero
－$L(Q)=$ the Leavitt path algebra

## Theorem（C．－Li－Wang）

Then there are isomorphisms in the homotopy category of
$B_{\infty}$－algebras

$$
C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \xrightarrow{\Upsilon} C^{*}(L(Q), L(Q)) \xrightarrow{\Delta} C^{*}\left(\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right), \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right)\right) .
$$

－Keller＇s conjecture holds for any $k Q / J^{2}$（iterated one－point coextensions），and also for gentle algebras（singular equivalence with level）．

## Keller＇s conjecture for algebras with radical square zero

－$Q=$ a finite quiver without sinks
－$A_{Q}=k Q / J^{2}$ the algebra with radical square zero
－$L(Q)=$ the Leavitt path algebra

## Theorem（C．－Li－Wang）

Then there are isomorphisms in the homotopy category of
$B_{\infty}$－algebras

$$
C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \xrightarrow{\Upsilon} C^{*}(L(Q), L(Q)) \xrightarrow{\Delta} C^{*}\left(\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right), \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right)\right) .
$$

－Keller＇s conjecture holds for any $k Q / J^{2}$（iterated one－point coextensions），and also for gentle algebras（singular equivalence with level）．
－We use the Leavitt path algebra $L(Q)$ as a bridge！

## The content

－An introduction to the singularity category
－Singular Hochschild cohomology and Keller＇s conjecture
－The main results
－Main ingredients of the proof

## To be explained

－What is Leavitt path algebra $L(Q)$ ？
－How does $A_{Q}=k Q / J^{2}$ relate to $L(Q)$ ？
－The categorical proof of

$$
\Delta: C^{*}(L(Q), L(Q)) \rightarrow C^{*}\left(\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right), \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right)\right)
$$

－The combinatorial proof of

$$
\Upsilon: C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))
$$

## Reminders on quivers

－$Q=\left(Q_{0}, Q_{1} ; s, t: Q_{1} \rightarrow Q_{0}\right)$ a finite quiver $(=$ oriented graph）
－$Q_{0}=$ the set of vertices，$Q_{1}=$ the set of arrows
－visualize an arrow $\alpha$ as $s(\alpha) \xrightarrow{\alpha} t(\alpha)$
－a vertex $i$ is called a sink，if $s^{-1}(i)=\emptyset$ ；
－We assume that $Q$ has no sinks．

## Reminders on path algebras

－a finite path in $Q$ is $p=\alpha_{n} \cdots \alpha_{2} \alpha_{1}$ of length $n$

$$
\cdot \xrightarrow{\alpha_{1}} \cdot \xrightarrow{\alpha_{2}} \cdots \cdots \xrightarrow{\alpha_{n}} .
$$

In this case，we set $s(p)=s\left(\alpha_{1}\right)$ and $t(p)=t\left(\alpha_{n}\right)$ ．
－paths of length one＝arrows；paths of length zero $=$ vertices （for $i \in Q_{0}$ ，we associate a trivial path $e_{i}$ ．）
－The path algebra $k Q: k$－basis $=$ paths in $Q$ ，the multiplication
$=$ concatenation of paths．

## Reminders on path algebras

－a finite path in $Q$ is $p=\alpha_{n} \cdots \alpha_{2} \alpha_{1}$ of length $n$

$$
\cdot \xrightarrow{\alpha_{1}} \cdot \xrightarrow{\alpha_{2}} \cdots \cdots \xrightarrow{\alpha_{n}} \cdot
$$

In this case，we set $s(p)=s\left(\alpha_{1}\right)$ and $t(p)=t\left(\alpha_{n}\right)$ ．
－paths of length one＝arrows；paths of length zero $=$ vertices （for $i \in Q_{0}$ ，we associate a trivial path $e_{i}$ ．）
－The path algebra $k Q: k$－basis $=$ paths in $Q$ ，the multiplication $=$ concatenation of paths．More precisely，for two paths $p$ and $q$ in $Q, p \cdot q=p q$ if $s(p)=t(q)$ ，otherwise，$p \cdot q=0$ ．
For example，$e_{i} e_{j}=\delta_{i, j} e_{i}, e_{i} p=\delta_{i, t(p)} p, p e_{i}=\delta_{s(p), i} p$.

## Reminders on path algebras，continued

－$Q_{n}=$ the set of paths in $Q$ of length $n$ ；then $k Q=\bigoplus_{n \geq 0} k Q_{n}$ is naturally $\mathbb{N}$－graded．
－The unit $1_{k Q}=\sum_{i \in Q_{0}} e_{i}$ has a decomposition into pairwise orthogonal idempotents．
－Set $J=\bigoplus_{n \geq 1} k Q_{n}$ ，the two－sided ideal of $k Q$ generated by arrows．
－The algebra $A_{Q}=k Q / J^{2}$ with radical square zero is finite dimensional．Indeed，$A_{Q}$ has a basis $\left\{e_{i} \mid i \in Q_{0}\right\} \cup\left\{\alpha \mid \alpha \in Q_{1}\right\}$ ，the multiplication rule is given by $e_{i} e_{j}=\delta_{i, j} e_{i}, e_{i} \alpha=\delta_{i, t(\alpha)} \alpha, \beta e_{j}=\delta_{s(\beta), j} \beta, \alpha \beta=0$ ．

## What is Leavitt path algebra？

$\bar{Q}=$ the double quiver of $Q$ ，that is，for each arrow $\alpha: i \rightarrow j$ in $Q$ ，we add a new arrow $\alpha^{*}: j \rightarrow i$ ．

## What is Leavitt path algebra？

$\bar{Q}=$ the double quiver of $Q$ ，that is，for each arrow $\alpha: i \rightarrow j$ in $Q$ ，we add a new arrow $\alpha^{*}: j \rightarrow i$ ．

## Definition（Abrams－Aranda Pino 2005／Ara－Moreno－Pardo 2007）

The Leavitt path algebra $L(Q)$ of $Q$ is the quotient algebra of $k \bar{Q}$ by the two－sided ideal generated by the following elements

## What is Leavitt path algebra？

$\bar{Q}=$ the double quiver of $Q$ ，that is，for each arrow $\alpha: i \rightarrow j$ in $Q$ ，we add a new arrow $\alpha^{*}: j \rightarrow i$ ．

## Definition（Abrams－Aranda Pino 2005／Ara－Moreno－Pardo 2007）

The Leavitt path algebra $L(Q)$ of $Q$ is the quotient algebra of $k \bar{Q}$ by the two－sided ideal generated by the following elements
－（CK1）$\alpha \beta^{*}-\delta_{\alpha, \beta} e_{t(\alpha)}$ ，for all $\alpha, \beta \in Q_{1}$ ；

## What is Leavitt path algebra？

$\bar{Q}=$ the double quiver of $Q$ ，that is，for each arrow $\alpha: i \rightarrow j$ in $Q$ ，we add a new arrow $\alpha^{*}: j \rightarrow i$ ．

## Definition（Abrams－Aranda Pino 2005／Ara－Moreno－Pardo 2007）

The Leavitt path algebra $L(Q)$ of $Q$ is the quotient algebra of $k \bar{Q}$ by the two－sided ideal generated by the following elements
－（CK1）$\alpha \beta^{*}-\delta_{\alpha, \beta} e_{t(\alpha)}$ ，for all $\alpha, \beta \in Q_{1}$ ；
－（CK2）$\sum_{\left\{\alpha \in Q_{1} \mid s(\alpha)=i\right\}} \alpha^{*} \alpha-e_{i}$ ，for all $i \in Q_{0}$ ．

## What is Leavitt path algebra？

$\bar{Q}=$ the double quiver of $Q$ ，that is，for each arrow $\alpha: i \rightarrow j$ in $Q$ ，we add a new arrow $\alpha^{*}: j \rightarrow i$ ．

## Definition（Abrams－Aranda Pino 2005／Ara－Moreno－Pardo 2007）

The Leavitt path algebra $L(Q)$ of $Q$ is the quotient algebra of $k \bar{Q}$ by the two－sided ideal generated by the following elements
－（CK1）$\alpha \beta^{*}-\delta_{\alpha, \beta} e_{t(\alpha)}$ ，for all $\alpha, \beta \in Q_{1}$ ；
－（CK2）$\sum_{\left\{\alpha \in Q_{1} \mid s(\alpha)=i\right\}} \alpha^{*} \alpha-e_{i}$ ，for all $i \in Q_{0}$ ．
Here，CK stands for Cuntz－Krieger．

## Example：The Leavitt algebra

## Example

Let $Q$ be the rose quiver with two petals．Then we have an isomorphism

$$
L(Q) \simeq \frac{k\left\langle x_{1}, x_{2}, y_{1}, y_{2}\right\rangle}{\left\langle x_{i} y_{j}-\delta_{i, j}, y_{1} x_{1}+y_{2} x_{2}-1\right\rangle}
$$

## Example：The Leavitt algebra

## Example

Let $Q$ be the rose quiver with two petals．Then we have an isomorphism

$$
L(Q) \simeq \frac{k\left\langle x_{1}, x_{2}, y_{1}, y_{2}\right\rangle}{\left\langle x_{i} y_{j}-\delta_{i, j}, y_{1} x_{1}+y_{2} x_{2}-1\right\rangle} .
$$

The latter algebra is called the Leavitt algebra $L_{2}$ of order two，

## Example：The Leavitt algebra

## Example

Let $Q$ be the rose quiver with two petals．Then we have an isomorphism

$$
L(Q) \simeq \frac{k\left\langle x_{1}, x_{2}, y_{1}, y_{2}\right\rangle}{\left\langle x_{i} y_{j}-\delta_{i, j}, y_{1} x_{1}+y_{2} x_{2}-1\right\rangle}
$$

The latter algebra is called the Leavitt algebra $L_{2}$ of order two， studied by W．Leavitt in 1958，related to the non－IBN property．

## Nice properties of the Leavitt path algebra

－The Leavitt path algebra $L(Q)$ is naturally $\mathbb{Z}$－graded as $L(Q)=\bigoplus_{n \in \mathbb{Z}} L(Q)_{n}$ with $e_{i} \in L(Q)_{0}, \alpha \in L(Q)_{1}$ and $\alpha^{*} \in L(Q)_{-1}$ ．

## Nice properties of the Leavitt path algebra

－The Leavitt path algebra $L(Q)$ is naturally $\mathbb{Z}$－graded as $L(Q)=\bigoplus_{n \in \mathbb{Z}} L(Q)_{n}$ with $e_{i} \in L(Q)_{0}, \alpha \in L(Q)_{1}$ and $\alpha^{*} \in L(Q)_{-1}$ ．
－$L(Q)_{n} \cdot L(Q)_{m}=L(Q)_{n+m}$ ，that is，$L(Q)$ is strongly graded．

## Nice properties of the Leavitt path algebra

－The Leavitt path algebra $L(Q)$ is naturally $\mathbb{Z}$－graded as $L(Q)=\bigoplus_{n \in \mathbb{Z}} L(Q)_{n}$ with $e_{i} \in L(Q)_{0}, \alpha \in L(Q)_{1}$ and $\alpha^{*} \in L(Q)_{-1}$ ．
－$L(Q)_{n} \cdot L(Q)_{m}=L(Q)_{n+m}$ ，that is，$L(Q)$ is strongly graded．
－The zeroth component subalgebra $L(Q)_{0}$ is a direct limit of finite products of full matrix algebras；in particular，it is von Neumann regular．

## Nice properties of the Leavitt path algebra

－The Leavitt path algebra $L(Q)$ is naturally $\mathbb{Z}$－graded as $L(Q)=\bigoplus_{n \in \mathbb{Z}} L(Q)_{n}$ with $e_{i} \in L(Q)_{0}, \alpha \in L(Q)_{1}$ and $\alpha^{*} \in L(Q)_{-1}$ ．
－$L(Q)_{n} \cdot L(Q)_{m}=L(Q)_{n+m}$ ，that is，$L(Q)$ is strongly graded．
－The zeroth component subalgebra $L(Q)_{0}$ is a direct limit of finite products of full matrix algebras；in particular，it is von Neumann regular．
－The subalgebra $\bigoplus_{i \in Q_{0}} e_{i} L(Q) e_{i}$ is related to parallel paths in $Q$ ，and also to an explicit colimit（namely， $(p, q) \mapsto q^{*} p \in L(Q)$ ；very useful to us，later！）．

## Some consequences

Consider the category $L(Q)$－grproj of finitely generated $\mathbb{Z}$－graded projective $L(Q)$－modules．

## Proposition

The category $L(Q)$－grproj is a semisimple abelian category．

## Some consequences

Consider the category $L(Q)$－grproj of finitely generated $\mathbb{Z}$－graded projective $L(Q)$－modules．

## Proposition

The category $L(Q)$－grproj is a semisimple abelian category．

The proof：strongly gradation implies that

$$
L(Q)-\text { grproj } \simeq L(Q)_{0} \text {-proj }
$$

Now，use the von Neumann regularity of $L(Q)_{0}$ ．
－We will consider the degree－shift $(1)$ on $L(Q)$－grproj．

## Some consequences

Consider the category $L(Q)$－grproj of finitely generated $\mathbb{Z}$－graded projective $L(Q)$－modules．

## Proposition

The category $L(Q)$－grproj is a semisimple abelian category．

The proof：strongly gradation implies that

$$
L(Q)-\text { grproj } \simeq L(Q)_{0} \text {-proj. }
$$

Now，use the von Neumann regularity of $L(Q)_{0}$ ．
－We will consider the degree－shift $(1)$ on $L(Q)$－grproj．
－

$$
\left(L(Q) e_{i}\right)(1) \simeq \bigoplus_{\left\{\alpha \in Q_{1} \mid s(\alpha)=i\right\}} L(Q) e_{t(\alpha)}
$$

## How does $A_{Q}$ relate to $L(Q)$ ？

## Theorem（Smith 2012）

There is an equivalence（of triangulated categories）

$$
\mathbf{D}_{\mathrm{sg}}\left(A_{Q}\right) \simeq L(Q) \text {-grproj }
$$

sending the simple $A_{Q}$－module $S_{i}$ to $L(Q) e_{i}$ ，with $\Sigma^{-1}$ corresponding to（1）．

## How does $A_{Q}$ relate to $L(Q)$ ？

## Theorem（Smith 2012）

There is an equivalence（of triangulated categories）

$$
\mathbf{D}_{\mathrm{sg}}\left(A_{Q}\right) \simeq L(Q) \text {-grproj }
$$

sending the simple $A_{Q}$－module $S_{i}$ to $L(Q) e_{i}$ ，with $\Sigma^{-1}$ corresponding to（1）．

The idea：the degree－shift functor（1）on $L(Q)$－grproj behaves similarly as the syzygy functor $\Omega$ on $A_{Q}-\underline{m o d}$ ．Now use stabilization as in［C．2011］．

## Enhancing Smith＇s equivalence

The dg level contains more rigid information，for example，the Hochschild cohomology．

## Enhancing Smith＇s equivalence

The dg level contains more rigid information，for example，the Hochschild cohomology．Enhancements：

$$
\mathbf{D}_{\mathrm{sg}}\left(A_{Q}\right) \rightsquigarrow \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right) \text { and } L(Q) \text {-grproj } \rightsquigarrow \mathbf{p e r}_{\mathrm{dg}}\left(L(Q)^{\mathrm{op}}\right)
$$

## Enhancing Smith＇s equivalence

The dg level contains more rigid information，for example，the Hochschild cohomology．Enhancements：

$$
\mathbf{D}_{\mathrm{sg}}\left(A_{Q}\right) \rightsquigarrow \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right) \text { and } L(Q) \text {-grproj } \rightsquigarrow \mathbf{p e r}_{\mathrm{dg}}\left(L(Q)^{\mathrm{op}}\right)
$$

## Proposition（C．－Li－Wang）

There is a zigzag of quasi－equivalences between

$$
\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right) \simeq \operatorname{per}_{\mathrm{dg}}\left(L(Q)^{\mathrm{op}}\right)
$$

Taking $H^{0}$ ，we recover Smith＇s equivalence．

## Enhancing Smith＇s equivalence

The dg level contains more rigid information，for example，the Hochschild cohomology．Enhancements：

$$
\mathbf{D}_{\mathrm{sg}}\left(A_{Q}\right) \rightsquigarrow \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right) \text { and } L(Q) \text {-grproj } \rightsquigarrow \mathbf{p e r}_{\mathrm{dg}}\left(L(Q)^{\mathrm{op}}\right)
$$

## Proposition（C．－Li－Wang）

There is a zigzag of quasi－equivalences between

$$
\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right) \simeq \operatorname{per}_{\mathrm{dg}}\left(L(Q)^{\mathrm{op}}\right)
$$

Taking $H^{0}$ ，we recover Smith＇s equivalence．
The idea：enhance a result of［Krause 2005］and use H．Li＇s injective Leavitt complex［Li 2018］，which gives an explicit compact generator to realize a triangle equivalence in［C．－Yang 2015］．

## The categorical proof of $\Delta$

## Proposition

There is an isomorphism in the homotopy category of $B_{\infty}$－algebras

$$
C^{*}(L(Q), L(Q)) \xrightarrow{\Delta} C^{*}\left(\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right), \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right)\right)
$$

## The categorical proof of $\Delta$

## Proposition

There is an isomorphism in the homotopy category of $B_{\infty}$－algebras

$$
C^{*}(L(Q), L(Q)) \xrightarrow{\Delta} C^{*}\left(\mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right), \mathbf{S}_{\mathrm{dg}}\left(A_{Q}\right)\right)
$$

Recall the fact that $C^{*}(-,-)$ is invariant under Morita morphisms between dg categories［Keller 2013］（eg．quasi－equivalences or $\left.L(Q) \hookrightarrow \boldsymbol{p e r}_{\mathrm{dg}}\left(L(Q)^{\mathrm{op}}\right)\right)$ ．Then use the above enhancement of Smith＇s equivalence．

## Towards $\Upsilon: C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$

We introduce two new and explicit $B_{\infty}$－algebras：

## Towards $\Upsilon: C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$

We introduce two new and explicit $B_{\infty}$－algebras：
（1）the combinatorial $B_{\infty}$－algebra $C_{\mathrm{sg}}^{*}(Q, Q)$ ，via parallel paths in $Q$（appearing in the relative bar resolution！），and taking colimits（as in $\left.C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right)\right)$

## Towards $\Upsilon: C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$

We introduce two new and explicit $B_{\infty}$－algebras：
（1）the combinatorial $B_{\infty}$－algebra $C_{\mathrm{sg}}^{*}(Q, Q)$ ，via parallel paths in $Q$（appearing in the relative bar resolution！），and taking colimits（as in $\left.C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right)\right)$
（2）the Leavitt $B_{\infty}$－algebra $\widehat{C}^{*}(L, L)$ ，whose algebra structure is a trivial extension of a subalgebra of $L=L(Q)$

$$
\bigoplus_{i \in Q_{0}} e_{i} L e_{i} \oplus s^{-1} \bigoplus_{i \in Q_{0}} e_{i} L e_{i}
$$

## Towards $\Upsilon: C_{s g}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$

We introduce two new and explicit $B_{\infty}$－algebras：
（1）the combinatorial $B_{\infty}$－algebra $C_{\mathrm{sg}}^{*}(Q, Q)$ ，via parallel paths in $Q$（appearing in the relative bar resolution！），and taking colimits（as in $\left.C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right)\right)$
（2）the Leavitt $B_{\infty}$－algebra $\widehat{C}^{*}(L, L)$ ，whose algebra structure is a trivial extension of a subalgebra of $L=L(Q)$

$$
\bigoplus_{i \in Q_{0}} e_{i} L e_{i} \oplus s^{-1} \bigoplus_{i \in Q_{0}} e_{i} L e_{i}
$$

So，we have

$$
C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \xrightarrow{\kappa} C_{\mathrm{sg}}^{*}(Q, Q) \xrightarrow{\rho} \widehat{C}^{*}(L, L)
$$

strict $B_{\infty}$－isomorphisms，where $\rho$ sends a parallel path $(p, q)$ to $q^{*} p \in L$ ！

## Towards $\Upsilon: C_{\mathrm{Sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$ ，continued

－an explicit bimodule projective resolution $P$ of $L=L(Q)$ ， together with a homotopy deformation retract（in particular，$L$ is quasi－free in the sense of［Cuntz－Quillen 1995］）；

## Towards $\Upsilon: C_{\mathrm{Sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$ ，continued

－an explicit bimodule projective resolution $P$ of $L=L(Q)$ ， together with a homotopy deformation retract（in particular，$L$ is quasi－free in the sense of［Cuntz－Quillen 1995］）；moreover， we have $\widehat{C}^{*}(L, L)=\operatorname{Hom}_{L^{e}}(P, L)$ ．

## Towards $\Upsilon: C_{\mathrm{Sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$ ，continued

－an explicit bimodule projective resolution $P$ of $L=L(Q)$ ， together with a homotopy deformation retract（in particular，$L$ is quasi－free in the sense of［Cuntz－Quillen 1995］）；moreover， we have $\widehat{C}^{*}(L, L)=\operatorname{Hom}_{L^{e}}(P, L)$ ．
－the homotopy transfer theorem for dg algebras yields an $A_{\infty}$－quasi－isomorphism

$$
\left(\Phi_{1}, \Phi_{2}, \cdots\right): \widehat{C}^{*}(L, L) \longrightarrow C^{*}(L, L)
$$

## Towards $\Upsilon: C_{\mathrm{Sg}}^{*}\left(A_{Q}, A_{Q}\right) \rightarrow C^{*}(L(Q), L(Q))$ ，continued

－an explicit bimodule projective resolution $P$ of $L=L(Q)$ ， together with a homotopy deformation retract（in particular，$L$ is quasi－free in the sense of［Cuntz－Quillen 1995］）；moreover， we have $\widehat{C}^{*}(L, L)=\operatorname{Hom}_{L^{e}}(P, L)$ ．
－the homotopy transfer theorem for dg algebras yields an $A_{\infty}$－quasi－isomorphism

$$
\left(\Phi_{1}, \Phi_{2}, \cdots\right): \widehat{C}^{*}(L, L) \longrightarrow C^{*}(L, L)
$$

－each $\Phi_{i}$ is explicit；by manipulation on brace $B_{\infty}$－algebras，we eventually verify that it is a $B_{\infty}$－morphism．

## The combinatorial proof of $\Upsilon$

In summary，we have

## Proposition

There is an isomorphism in the homotopy category of $B_{\infty}$－algebras

$$
C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \xrightarrow{\Upsilon} C^{*}(L(Q), L(Q)) .
$$

## The combinatorial proof of $\Upsilon$

In summary，we have

## Proposition

There is an isomorphism in the homotopy category of $B_{\infty}$－algebras

$$
C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \xrightarrow{\Upsilon} C^{*}(L(Q), L(Q)) .
$$

It is given by the following composition：

$$
\begin{aligned}
& C_{\mathrm{sg}}^{*}\left(A_{Q}, A_{Q}\right) \cdots \cdots \cdots \cdots \cdots C^{*}(L, L)
\end{aligned}
$$
